Scarselli M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.
                                                                                                     The sequence given is a protein which is useful as an antimycotic agent. The protein has a molecular weight of approx. 13000 and is thermostable for 5-10 minutes when heated to 100 degrees C. The protein may be incorporated into food additives for humans and animals. The protein can be obtained by collecting the body fluids of insect larvae of Diptera or Hymenoptera (eg. sarcophaga peregrina), centrifuging the solution and subjecting the supernatant to reverse
                                                                                                                                                                                                                                                                            Gaps
                                            Abtimycotic protein useful as food additive - found in insect larvae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel Neisserial polypeptides predicted to be useful antigens for vaccines and diagnostics

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, antibodies and composition. The polypeptides, and invention of the present invention of manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. menhalgitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polypuctocolis.

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY5941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ5437 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5487976
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Solderlund, David M.
APPLICANT: Knipple, Douglas C.
APPLICANT: Henderson, Joseph E.
TITLE OF INVENTION: Gene Encoding An Insect
TITLE OF INVENTION: Gamma-Aminobutyric Acid (GABA) Receptor Subunit
NUMBER OF SEQUENCES: 31
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Zea mays protein Zea mays protein Zea mays protein Sequence of the Ri

```
The present sequence is the antigenic epitope P600, derived from apical membrane antigen-1 (AMA-1) of the asexual blood stage of plasmodium falciparum. It is used in the construction of recombinant protein comprises, malitivalent, multistage malarial vaccine. The recombinant protein comprises, malitim signal peptide, vaccine. The recombinant protein comprises, malitim signal peptide, cancine. The recombinant protein comprises, malitim signal peptide, vaccine. The recombinant protein comprises, malitim signal peptide, cancine protein-2 from circumsporozoite protein (SSP-1), merozoite surface protein-1 (SSP-2), liver stage antigen-1 (SA-1), merozoite surface protein-1 (SSP-1), merozoite surface protein-1 cancine. Thopity associated protein-1 (RAP-1) and gamete specific antigen-175 (EBA-175), rhopity associated protein-1 (RAP-1) and gamete specific antigen of P. falciparum. CDC/NIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of antiparal infections. Anti-CDC/NIMALVAC-1 antibodies can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; csp: circumsporozoite protein; CSP; sporozoite surface protein:2; SSP-2; apical stage antigen:1, ESA-1; merozoite surface protein:1, MSP-1; MSP-2; apical membrane antigen:1, AMA-1; erythrocyte binding antigen:175; EBA-175; rhoptry associated protein:1; RAP-1; gamete specific antigen; pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;
    Novel recombinant protein as vaccine for treating malarial infection comprises antiquence peptides obtained from different stages of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23..350

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical antigen-1 (LSA-1), revitable binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Ffg27. These epitopes were obtained at different stages of the life cycle of presmodium falloparum (CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.

New recombinant poxviruses containing either the SERA, ABRA, Pfhsp70, AMA-1, Pfs25, Pfs16, CSP, PfSSP2, LSA-1, LSA-1 repeatless, MSA-1, MSA-1 (N-terminal pf8 or C-terminal pf942) genes, or a combination of these in non-essential regions of their genomes are claimed. These poxviruses (pref. with a virulence reducing genomic deletion or disruption) can be used as vaccines against malaria and for the prodn. of Plasmodium immunogens. These viruses provide multicomponent, multistage vaccines due to their expression of sporozite, liver stage, blood stage and sexual stage proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                Plasmodium vivax 66kD merozoite antigen protein partial sequence.
                                                                                                                                                                                 This protein is encoded by a recombinant DNA molecule comprising the complete P.Knowlesi merosoite antigen gene and e.g. a pUCL9 or vacchia virus vector sequence and regulatory elements. This allows efficient expression of the antigen on transformation of host cells. It is useful in an anti-malarial vaccine for conferring immunity against the merozoite form of the parasite and preventing infection of uninfected red blood cells. See also AAO10869.
                                                                                                                                            Plasmodium merozoite antigen proteins and DNA sequences – useful

                                                                                 This protein is encoded by a recombinant DNA molecule comprising the complete P.vivax merozoite antigen gene and e.g. a pUC19 or vaccinia virus vector sequence and regulatory elements. This allows efficient expression of the antigen on transformation of host cells. It is useful in an anti-malarial vaccine for conferring immunity against the merozoite form of the parasite and preventing infection of uninfected red blood cells.
plasmodium merozoite antigen proteins and DNA sequences – useful
in vaccine prodn., anti-malarial drug design, and in diagnostics

ALIGNMENTS

	RESULT 1 A3249 aptical membrane antigen 1 - malaria parasite (Plasmodium falciparum) C; Species: Plasmodium falciparum C; Species: Plasmodium falciparum C; Date: 12-Oct-1989 #sequence_revision 12-Oct-1989 #text_change 09-Jun-2000 C; Accession: A32499 R; Peterson, M.G.; Marshall, V.M.; Smythe, J.A.; Crewther, P.E.; Lew, A.; Silva, A.; A Wol. Cell. Biol. 9, 3151-3154, 1989 A; Title: Integral membrane protein located in the apical complex of Plasmodium falcip A; Reference number: A32499; MUID: 89384584 A; Scatus: preliminary A; Status: preliminary A; Status: preliminary A; Status: Preliminary A; Status: C; Peterson A; Cross-references: GB: A27133; NID: 9160072; PID: 9160073 C; Keywords: membrane protein; surface antigen
	Ouery Match 100.0%; Score 100; DB 2; Length 622; Best Local Similarity 100.0%; Pred. No. 1.4e-08; Matches 18; Conservative 0; Mismatches 0; Indels 0; Gaps 0; Qy 1 DGNCEDIPHVNEFSAIDL 18 Db 317 DGNCEDIPHVNEFSAIDL 334
•	RESULT 2 D44986 apical membrane antigen 1 - malaria parasite (Plasmodium falciparum) (strain 7G8) C, Species: Plasmodium falciparum C, Species: Plasmodium falciparum C, Species: Plasmodium falciparum C, Date: 28-Apr-1993 #sequence_revision 28-Apr-1993 #text_change 09-Jun-2000 C, Accession: D44986 R, Thomas A. W.; Waters, A. P.; Carr, J. Mol. Blochem. Parasitol. 42, 285-288, 1990 A, Title: Analysis of variation in PF83, an erythrocytic merozoite vaccine candidate a A, Reference number: A44986; MUID:91101665 A, Accession: D44986 A, Status: preliminary; nucleic acid sequence not shown; not compared with conceptual A, Molecule type: DNA A, Residues: 1-622 < THO> A, Residues: 1-622 < THO> A, Residues: 1-622 < THO> C; Keywords: membrane protein; surface antigen
